HOW TO NAME NEW CHEMICAL ELEMENTS

Provisional Recommendations

Abstract: A procedure is proposed to name new chemical elements. After the discovery of a new element is established by the joint IUPAC-IUPAP Working Group, the discoverers are invited to propose a name and a symbol to the IUPAC Inorganic Chemistry Division. Elements can be named after a mythological concept, a mineral, a place or country, a property or a scientist. After examination and acceptance by the Inorganic Chemistry Division, the proposal follows the accepted IUPAC procedure and is then ratified by the Council of IUPAC. This document is a slightly amended version of the 2002 IUPAC Recommendations; the most important change is that the names of all new elements should have an ending that reflects and maintains historical and chemical consistency. This would be in general “-ium” for elements belonging to groups 1-16, i.e. including the f-block elements, “-ine” for elements of group 17 and “-on” for elements of group 18.

CONTENTS

1. Introduction
2. Existing recommendations
3. Choice of names for new elements
4. Procedure for naming a new element

1. INTRODUCTION

As early as 1782 it was stated by Guyton de Morveau that, in the interest of science, it was necessary to have “a constant method of denomination, which helps the intelligence and relieves the memory” [1]. Ideally, a chemical element or a compound should have a unique name because the proliferation of names for the same substance can lead to confusion.

A case in point, but not the only one, is element 104, for which the names rutherfordium and kurchatovium were used for nearly three decades by competing laboratories. At the heart of the

1
2
3 problem is the belief of the discoverers that they have the sole right to name a new element.
4
5 However, given a decision by IUPAC in 1947, discoverers have the right to *suggest* a name to
6
7 IUPAC. In fact, only the IUPAC Commission on Nomenclature of Inorganic Chemistry, after an
8
9 examination of the suggested name to determine its suitability and a public and expert review
10
11 process, could make a recommendation to the IUPAC Council. On January 1, 2002, when the IUPAC
12
13 Commission for the Nomenclature of Inorganic Chemistry ceased to exist, this responsibility was
14
15 taken over by the IUPAC Inorganic Chemistry Division to which this Commission belonged. The
16
17 IUPAC Council still makes the final decision (see below).
18

19
20 While the origin of the names of some elements is obscure, the names of many have been
21
22 based on a property of the element, a mineral from which it was isolated, its place or area of
23
24 discovery, a mythological character or concept, an astronomical object, or the name of an eminent
25
26 scientist.

27
28 At the time of writing the previous recommendation (years before 2002), it was apparently
29
30 not anticipated that the pace of discoveries of new heavy elements would soon lead to new elements
31
32 of the halogen and the noble gas groups. As it is now expected that these elements are well within
33
34 reach and given the objections to the suffix *-ium* for these elements to avoid linguistic confusion and
35
36 educational difficulties [2], IUPAC has decided to amend the 2002 Recommendation [3] in order to
37
38 allow for more appropriate naming of future elements that would belong to group 17 and 18.

39 **2. EXISTING RECOMMENDATIONS**

40
41 Although the historical aspects of the debate on the naming of the transfermium elements is
42
43 outside the scope of this article, there are three issues that are relevant here: (1) priority of discovery,
44
45 (2) the right of discoverers to suggest names, and (3) the role of the IUPAC Commission on
46
47 Nomenclature of Inorganic Chemistry (now IUPAC Division II). These issues were first addressed
48
49 in 1947, as discussed in Ref. [4]:
50

51
52 "It was decided at the 1947 conference of the International Union of Chemistry, held
53
54 in London, that in the future the naming of elements and all questions relating to the
55
56 names and symbols of the elements should be dealt with by joint meetings of the
57
58
59
60

1
2
3 Commissions of Inorganic Nomenclature and of Atomic Weights. Such matters had
4
5 previously been dealt with by the Commission of Atomic Weights alone.
6

7 It has been accepted in the past that the discoverers of a new element had the sole
8
9 right to name it. Sometimes two different names have been given for the same element
10
11 at about the same time and now it is often difficult to decide which was actually given
12
13 first. Moreover, a name which was given later in point of time may have come into more
14
15 general use or be more suitable than the name first given and there are cases of this kind
16
17 in the International Table of Atomic Weights, so that the acceptance of a given name for
18
19 an element must not be regarded as bearing any claim to priority of discovery. Priority is
20
21 only one factor to be considered in deciding which is the best name for general
22
23 international adoption. This presumptive right to name new elements is now accorded to
24
25 the discoverers of new elements produced artificially, but subject to the approval of the
26
27 Nomenclature Commission of IUPAC.”
28

29 The right of discoverers to suggest names was recognized in 1990 and repeated in 2005 ([5] Section
30
31 IR-3.1):
32

33 ”Elements of atomic numbers greater than 103 are often referred to in the scientific
34
35 literature but receive names only after they have been discovered. Names are needed for
36
37 these elements even before their existence has been established and therefore IUPAC
38
39 has approved a systematic nomenclature and series of three-letter symbols for the atoms
40
41 of such elements ([5] Section IR-3.1.1 and Table II, [6]).
42

43 The existence of this systematic nomenclature does not override the right of
44
45 discoverers of new elements to suggest other names to IUPAC after their claim has been
46
47 established beyond all doubt in the general scientific community.”
48

49 These important quotations establish that, in the past: (1) the discoverers of new elements had the
50
51 right to suggest names, (2) the IUPAC Commission on Nomenclature of Inorganic Chemistry was
52
53 given the responsibility to examine such names and to conduct a public and private review process to
54
55 determine their suitability before recommending one of them to the Council of IUPAC for decision,
56
57 and (3) priority of discovery could, but did not have to, be taken into account. As to the involvement
58
59
60

1
2
3 of the IUPAC Commission on Atomic Weights, in 1949 it ceded the responsibility for naming the
4 newly discovered elements 43, 61, 85, 87, 93–96 and elements 4, 41, 71, 72, 74 and 91, for which
5 two or more names were current, to the Commission on Nomenclature for Inorganic Chemistry [7].
6
7 Furthermore, it could be established that in 1957 the Commission on Atomic Weights was not
8
9 involved in the naming of elements 99-102 [8].
10
11

12 The following quotations are relevant to the selection of names:

13 "Any new metallic elements should be given names ending in -ium". [4]
14

15 "...Other elements recognised (or discovered) during the past three centuries were
16 named according to various arbitrary associations of origin, physical or chemical
17 properties, etc., and more recently to commemorate the names of some famous
18 scientists." ([5] Section I-3.3.1)
19

20 "...It is desirable that the names of elements in different languages differ as little as
21 possible. The names approved by IUPAC are based on considerations of practicality
22 and prevailing usage. It is emphasised that the IUPAC selection carries no implication
23 regarding priority of discovery." ([5] Section I-3.3.2)
24
25

26 This strategy and the guidelines formulated in 1947 should obviate the problem of multiple
27 names from different laboratories for the same element. The responsibility for formally
28 recommending a name to the Council of IUPAC now rests solely with the Inorganic Chemistry
29 Division, which then follows the procedure outlined below for recommending a name to the Council
30 of IUPAC. This procedure differs from the IUPAC guidelines of 1947 in that priority of discovery
31 will be assigned by a joint IUPAC-IUPAP Working Group [9-11], and that only the laboratory(ies) to
32 which priority has been assigned is (are) allowed to propose a name and a symbol. The issue of
33 priority applies only to newly discovered elements; if and when the priority of discovery of an
34 already-named element is successfully challenged, then this element will not be renamed [12], which
35 was the case of element 102 (nobelium).

3. CHOICE OF NAMES FOR NEW ELEMENTS

In keeping with tradition, elements are named after:

- (a) a mythological concept or character (including an astronomical object),
- (b) a mineral, or similar substance,
- (c) a place, or geographical region,
- (d) a property of the element, or
- (e) a scientist.

To avoid confusion in the literature, when a name has been used for a particular element, but a different name is ultimately chosen for that element, then the first name cannot be transferred for use for another element. A case in point is element 105 for which the name hahnium has been in use. Since the name dubnium was ultimately chosen for that element, hahnium cannot be used for another as yet unnamed element. In addition, when a certain symbol has been in use for a particular element, it cannot be transferred for use for another element [13]. For example, for element 112 the symbol Cp was not acceptable because it was used for cassiopeium (now lutetium) in the past.

The names of all new elements should have an ending that reflects and maintains historical and chemical consistency. This would be in general “-ium” for elements belonging to groups 1-16, “-ine” for elements of group 17 and “-on” for elements of group 18. *N.B. The present recommendation is here more specific than that written in the 2002 document [3].*

4. PROCEDURE FOR NAMING A NEW ELEMENT

4.1. Formal proposal of a name

When the joint IUPAC-IUPAP Working Group has decided that the claims for the discovery of a new element fulfill the necessary criteria, the discoverers and the IUPAC Inorganic Chemistry Division are informed. Within two months of receiving the report from the joint IUPAC-IUPAP Working Group, the President of the Inorganic Division will invite the discoverers to propose a name and symbol for consideration. The proposal must be accompanied by a justification of the choice. If no such proposal is received within six months after the invitation, the Inorganic Chemistry Division shall take the initiative to propose a name, which will be submitted to the Council of IUPAC within

two years of initiating the process. Similarly, when, in the case of a joint discovery, the laboratories involved cannot agree on a name and symbol within six months after the invitation, then the Inorganic Chemistry Division shall take the initiative.

4.2. Examination by the Inorganic Chemistry Division and public review

The Inorganic Chemistry Division examines the proposed name and symbol for suitability and, if satisfied, take these through the accepted IUPAC procedure [14], according to which a Provisional Recommendation is written and sent to 15 experts, officers of other interested commissions, the Interdivisional Committee on Terminology, Nomenclature and Symbols, and posted on the IUPAC website for interested individuals. The opinion of IUPAP will also be sought. Should difficulties arise in any of these processes that make the proposed name unacceptable, then the Inorganic Chemistry Division will correspond with the laboratory or laboratories concerned to seek their agreement to any necessary changes or to an alternative name or symbol suggested for its consideration.

4.3. Formal naming of the element

When these processes are complete, the President of the Inorganic Chemistry Division forwards the Division's final recommendation for the name of a new element to the Council of the IUPAC for formal approval by the Union and publication in *Pure and Applied Chemistry*.

4.4. Interim names

Prior to and during the naming process, the element may be referred to by its atomic number, for example as in 'element 118', or by its provisional systematic name, 'ununoctium'. If a symbol is needed, the systematic, provisional three-letter symbol should be used ([5], Section IR-3.3.1 and Table II, [6]), irrespective of the position of the element.
