## Compound 5:

Preparation of the salicylic acid-borane complex: In a dry flask flushed several times with argon, the salicylic acid solution ( 173 mg dissolved in 3.0 mL abs. THF at $0{ }^{\circ} \mathrm{C}$ ) was treated with 1.3 mL of $\mathrm{BH}_{3}$. THF ( 1.0 M solution) in slow addition. The solution was stirred for 30 min until no more gas was evolved.

To a solution of (3), prepared by dissolving $106 \mathrm{mg}(126 \mu \mathrm{~mole}, 1 \mathrm{eq})$ in 2.0 mL abs. THF in a dry 50 mL round bottom flask at $0^{\circ} \mathrm{C}$, the salicylic acid-borane complex was slowly added and stirred for 1 h at $0^{\circ} \mathrm{C}$. After conducting the reaction for four weeks at $2{ }^{\circ} \mathrm{C}$, it was quenched with slow addition of 1.0 mL of 6.0 M NaOH solution followed by oxidation with 2.0 mL of $35 \% \mathrm{H}_{2} \mathrm{O}_{2}$ solution with vigorous stirring for 2 h. Extracting the solution with chloroform twice followed by washing the organic phase with saturated solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and drying with $\mathrm{MgSO}_{4}$. Removing the solvent and separating the crude material on silica gel column chromatography which eluted with EA/PE (1:2) yielded 36 mg of (5) (34\%), 24 mg of the less polar methylene alcohol (in-between product) in addition to 10 mg of the starting material (3).

HMBC Experiment: (18-H, C-14), (18-H, C-12), (17-H, C-12), (21-H, C-17), (21-H, C-22), (18'-H, C-14'), (16'-H, C-14'), (17'-H, C-22'), (21'-H, C-17'), (21'-H, C-22'). Notes and spectral comparison between (4) and (5): from 1D-NMR, it was noticed that $15^{\prime}$ and $16^{\prime}-\mathrm{H}$ in (4) are about 0.1 ppm down-fielded than their corresponding values in (5). However, the highest ${ }^{13} \mathrm{C}$-chemical shift difference between (4) and (5) was recorded for $\mathrm{C}-14$ which was about 2.7 ppm . On the other hand, a remarkable difference in the chemical shift between the two protons at $\mathrm{C}-28$ was noticed. The $\left|\mathrm{J}_{\text {geminal }}\right|$ between 28a and 28b-H in the closed-half of (5) was about 8-folds larger than that in the opened-half of (4). This established a quick technique to determine the opened-side in such analogues rather than 2D-NMR analysis.

## Compound 7:

A solution of compound (6), resulted from dissolving 60 mg ( $68.6 \mu \mathrm{~mol}$ ) in 5.0 mL abs. THF at $0^{\circ} \mathrm{C}$, was treated with 3-methoxycatechol-borane complex ( 15 mg of the ligand dissolved in 1.0 mL of abs. THF and 0.1 mL of $\mathrm{BH}_{3}$.THF). After stirring for one day at $(0-5)^{\circ} \mathrm{C}$, the substrate was further treated with 5-chlorosalicylic acidborane complex ( 120 mg of the ligand ( $670 \mu \mathrm{~mol}$ ) in 3.0 mL abs. THF and 1.0 mL $\mathrm{BH}_{3}$.THF ( 1.0 M ) prepared using the above-mentioned standard procedure. The reaction was conducted in refrigerator at $5^{\circ} \mathrm{C}$ for further 3 days before quenching it with 0.6 mL of 6.0 M NaOH solution followed by adding 0.6 mL of $35 \% \mathrm{H}_{2} \mathrm{O}_{2}$ solution and stirring for 1 h . Washing with saturated sodium carbonate solution twice to get ride of the free ligand followed by removing the solvent under low pressure, resulted in a light yellow crude material which after column chromatographic separation (silica gel, EA/PE (1:2) elution) yielded $47 \mathrm{mg}(78 \%)$ of the mono-opened product (7) in addition to 8 mg of the untransformed in-between product.

## Compound 9:

A solution of ( $\mathbf{8}$ ) ( $55 \mathrm{mg}, 60.8 \mu \mathrm{~mol}$, dissolved in 2 mL abs. THF at $0^{\circ} \mathrm{C}$ ) was treated with the diaminobenzonitrile-borane complex. This complex was prepared from dissolving 80 mg of diaminobenzonitrile ( $600 \mu \mathrm{~mol}$ ) in 3 mL abs.THF at $0^{\circ} \mathrm{C}$ followed by slow addition of 0.6 mL of $\mathrm{BH}_{3}$. THF ( 1 M solution) then stirring for 30 min . The combined solution was stirred for 1 h at $0^{\circ} \mathrm{C}$ and conducted in refrigerator at $8^{\circ} \mathrm{C}$ for one week which then resulted in a multi-spot products with one major (TLC follow). The reaction was worked up by adding 2 mL of 5.0 M NaOH solution and 2 mL of $35 \% \mathrm{H}_{2} \mathrm{O}_{2}$ solution and stirring vigorously for 2 h followed by extracting the resulted products with chloroform twice. Removing the solvents from the combined organic phase after drying with $\mathrm{MgSO}_{4}$ and chromatographic separation of the crude material on column chromatography (silica gel, 1:2 EA:PE eluent) resulted in 20 mg of (9) (36\%) in addition to 12 mg of (10) and 7 mg of the starting material (8).
