## Synthesis

## General Remarks

All solvents were dried with molecular sieves for at least 24 h prior to use. Thin layer chromatography (TLC) was performed on silica gel 60 F254 plates (Merck) with detection using UV light when possible, or by charring with a solution of concd. $\mathrm{H}_{2} \mathrm{SO}_{4} / \mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}(5: 45: 45)$ or a solution of $\left(\mathrm{NH}_{4}\right)_{6} \mathrm{Mo}_{7} \mathrm{O}_{24}(21 \mathrm{~g}), \mathrm{Ce}\left(\mathrm{SO}_{4}\right)_{2}(1 \mathrm{~g})$, concd. $\mathrm{H}_{2} \mathrm{SO}_{4}(31 \mathrm{~mL})$ in water ( 500 mL ). Flash column chromatography was performed on silica gel 230-400 mesh (Merck). ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded at $25^{\circ} \mathrm{C}$ unless otherwise stated, with a Varian Mercury 400 MHz instrument. Chemical shift assignments, reported in ppm, are referenced to the corresponding solvent peaks. HRMS were recorded on a QSTAR elite LC/MS/MS system with a nanospray ion source. Optical rotations were measured at room temperature using an Atago Polax-2L polarimeter and are reported in units of $10^{-1}$ deg $\cdot \mathrm{cm} 2 \cdot \mathrm{~g}^{-1}$.

General synthetic strategy for the synthesis of protected compounds 22 and 23: Airoldi, C.; Cardona, F.; Sironi, E.; Colombo, L.; Salmona, M.; Silva, A.; Nicotra, F.; La Ferla, B. Chemical Communications 2011, 47, 10266.

A mixture containing the appropriate O-hydroxybenzaldehyde (19-20) (2.5 equiv.), trimethylorthoformiate ( 2.5 equiv.) and scandium triflate ( $3 \% \mathrm{~mol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ is stirred at r.t. for 20 min . The mixture is then cooled at $0^{\circ} \mathrm{C}$ and tri- $O$-benzyl-D-galactal (21) is added. The reaction is then left stirring at r.t. for 30 min . The reaction is then diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, washed with water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtrated and the solvent is removed under reduced pressure. The crude is purified by flash chromatography, Toluene/AcOEt (9.75:0.25) to afford pure compounds (22-23).

To a 6 mM solution of the protected compound in $\mathrm{AcOEt} / \mathrm{MeOH} 1: 1$, previously degassed, $\mathrm{Pd}(\mathrm{OH})_{2}$ $5 \% \mathrm{~mol}$ is added and the reaction mixture is stirred under $\mathrm{H}_{2}$ atmosphere for $45 \mathrm{~min} .-1.5 \mathrm{~h}$. Then the catalist is removed by filtration and the solvent evaporated under reduced pressure to afford pure compounds ( 5 and 12).

## NMR binding studies

NMR experiments were recorded on a Varian $400-\mathrm{MHz}$ Mercury. A batch of A $\beta 1-42$ was selected that contained pre-amyloidogenic seeds highly toxic to N 2 a cells. Immediately before use, lyophilized $\mathrm{A} \beta 1-42$ was dissolved in 10 mM NaOD in $\mathrm{D}_{2} \mathrm{O}$ at a concentration of $160 \mu \mathrm{M}$, then diluted $1: 1$ with 20 mM phosphate buffer, pH 7.4 containing one of the tested compounds. Compounds 2, 3 and 4 were dissolved in $\mathrm{PB}, \mathrm{pH} 7.4$, and added to the peptide solution; for compound $45 \%$ of d-DMSO was added. The pH of each sample was verified with a Microelectrode (Mettler Toledo) for 5 mm NMR tubes and adjusted with NaOD or DCl . All pH values were corrected for isotope effect. Basic sequences were employed for ${ }^{1} \mathrm{H},{ }^{19} \mathrm{~F}, 2 \mathrm{D}-\mathrm{TOCSY}, 2 \mathrm{D}-$ NOESY and STD experiments. For STD, a train of Gaussian-shaped pulses each of 50 ms was employed to saturate selectively the protein envelope; the total saturation time of the protein envelope was adjusted by the number of shaped pulses and was varied between 3 s and 0.3 s .

## Sections staining

Brain tissue from Tg CRND8 mice encoding a double mutant form of amyloid precursor protein 695 (KM670/671NL + V717F) under the control of the PrP gene promoter (Chishti et al., 2001) were dissected and were fixed in Carnoy's and embedded in paraffin.
Procedures involving animals and their care were conducted in conformity with the institutional guidelines that are in compliance with national (D.L. No. 116, G.U. Suppl. 40, Feb. 18, 1992, Circolare No. 8, G.U., 14 Luglio 1994) and international laws and policies (EEC Council Directive 86/609, OJ L 358, 1 Dec.12, 1987; NIH Guide for the Care and use of Laboratory Animals, U.S. National Research Council, 1996). All efforts were made to minimize the number of animals used and their suffering.

Seven-micrometer-thick serial sections of paraffin-embedded blocks from the temporal cortex were mounted on gelatin coated microscope slides and used for staining. Paraffin sections were subjected to two incubations of 5 min in xylene, an incubation of 10 min each in $100 \%-96 \%-70 \%$ EtOH for the complete dewaxing and two successive incubations of 5 min in water. Tissue sections were covered with a solution $3 \mu \mathrm{M}$ of thioflavine T or $6 \mu \mathrm{M}$ of compound 3 dissolved in water. After 30 min of incubation, the sections were washed 3 times for 5 min in water and 5 min each in $70 \%-96 \%-100 \% \mathrm{EtOH}$. The sections were then incubated 5 min in xylene before adding the coverslip. Sections were visualized by fluorescent fluoromicroscope M-3204CCCD (OlympusBX61) equipped with the filters FITC ( Ex 488 nm ) for detecting thioflavine T and DAPI (Ex 405 nm ) for detecting test compounds.

## Transport Experiments

Trans-endothelial-electrical resistance (TEER) were measured by EVOMX meter, STX2 electrode, World Precision Instruments, Sarasota, Florida.
Fluorescence measurements were done using a Cary Eclipse spectrofluorimeter (Varian Inc., Palo Alto, California).

The radioactivity assay were achieved by means of a Tri-Carb 2200 CA Liquid Scintillation Analyzer (Packard Instrument Co. Inc., Rockville, MD)

The differences were evaluated for statistical significance using Student's t-test.

For transport experiments across a cell monolayer, hCMEC/D3 were seeded in a 12-well Transwell® inserts coated with type I collagen. 0.5 mL of cell suspensions containing $2.0 \cdot 105$ cells were added to the upper (donor) chamber which was inserted into the lower (acceptor) chamber containing 1.0 mL of the culture medium. A cell monolayer was usually formed 14 days after seeding judged by three criteria: (1) the cells formed a confluent monolayer without visible spaces between cells under a light microscope; (2) the height of the culture medium in the upper chamber had to be at least 2 mm higher than that in the lower chamber for at least 24 h ; and (3) a constant TEER (trans endothelial electrical resistance) value, measured using an EVOM Endohm chamber. Wells were used when TEER value was higher than $50 \Omega \cdot \mathrm{~cm}^{2}$. Trans-endothelial permeability coefficient (PE) was calculated as reported by Bickel U. (NeuroRx: The Journal of the American Society for Experimental NeuroTherapeutics ,Vol. 2, 15-26, January 2005):

After adding the test substance to the donor compartment, repeated samples are taken from the donor compartment over the desired time course. The concentration measured in these samples and the known volumes of the compartments
( $\mathrm{V}_{\text {donor }}$ and $\mathrm{V}_{\text {acceptor }}$ ) are used to calculate the incremental clearance volumes $\Delta \mathrm{V}_{\mathrm{Cl}}$ for each time point:
$\Delta \mathrm{V}_{\mathrm{Cl}}=\mathrm{C}_{\text {acceptor }} \cdot \mathrm{V}_{\text {acceptor }} / \mathrm{C}_{\text {donor }}$

As long as the concentration in the acceptor compartment is small and $\Delta \mathrm{V}_{\mathrm{Cl}}$ increases in linear manner, the
slope of the line can be interpreted as the PS product for unidirectional transfer. With the known exchange surface,

S , (filter area) the permeability may be obtained as $\mathrm{P}=\mathrm{PS} / \mathrm{S}$. Finally, a correction needs to be made for
the permeability of the cell-free filter:
$1 / \mathrm{P}_{\text {endothel }}=1 / \mathrm{P}_{\text {totall }}-1\left(\mathrm{P}_{\text {filter }}\right)$

With $\mathrm{P}_{\text {endothel }}$ being equal to PE .

After adding the test substance to the upper compartment, samples were taken from the lower compartment at different times ( $0-60-180 \mathrm{~min}$ ) for liquid scintillation counting (C14 sucrose) and for fluorescence assays (compound 3). At the end of the experiments, TEER and [14C]sucrose PE were re-determined in order to prove no occurrence of adverse effects on tight junction function due to sample application.
